'NARITA 22' is a high-yielding and disease-resistant hybrid that is related, through its female grandparent, to a group of cooking and beer bananas called East African highland bananas (EAHB). 'NARITA 22' is named after NARO and IITA, the institutes that jointly developed the NARITA hybrids[1].

Two crosses were performed to obtain 'NARITA 22'. The triploid EAHB cultivar 'Enzirabahima' was crossed with a wild source of disease resistance to produce a tetraploid. This tetraploid was then crossed with an improved diploid to produce the triploid hybrid 'NARITA 22' (see Breeding strategy below).

‘NARITA 22’ has been tested on station in Uganda[2] and is being evaluated in a broader range of end-users environments (including farmers’ fields), to assess its potential for adoption by farmers and consumers[3]. Its primary use is as a cooking type.

Breeding strategy

‘NARITA 22’ is a secondary triploid obtained by crossing a disease-resistant tetraploid (917K-2) with an improved diploid (9128-3)[4].

The tetraploid female parent 917K-2 was obtained by crossing the triploid EAHB cultivar...
‘Enzirabahima’ and Calcutta 4, a genebank accession of the diploid wild species *Musa acuminata ssp. burmannica*, which provided a copy of the so-called *A* genome. Calcutta 4 provided the resistance to black leaf streak.

The diploid male parent 9128-3 (whose code used to be preceded by TMBx, for tropical *Musa* bananas⁵) had been obtained by crossing two diploid cultivars: ‘Tjau Lagada’ and ‘Pisang Lilin’.

**Agronomic performance**

The following agronomic data were collected during a preliminary yield trial carried out by IITA and NARO at Namulonge in Central Uganda⁴:

<table>
<thead>
<tr>
<th>Traits</th>
<th>NARITA 22*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plant height at flowering (cm)</td>
<td>319.3</td>
</tr>
<tr>
<td>Pseudostem girth at flowering (cm)</td>
<td>51.2</td>
</tr>
<tr>
<td>Time from flowering to harvest (days)</td>
<td>144.6</td>
</tr>
<tr>
<td>Bunch weight (kg)</td>
<td>19.7</td>
</tr>
<tr>
<td>Number of hands</td>
<td>7.9</td>
</tr>
<tr>
<td>Number of fingers</td>
<td>134.5</td>
</tr>
<tr>
<td>Fruit circumference (cm)</td>
<td>12.5</td>
</tr>
<tr>
<td>Fruit length (cm)</td>
<td>20.7</td>
</tr>
<tr>
<td>Number of functional leaves at flowering</td>
<td>10.8</td>
</tr>
<tr>
<td>Number of functional leaves at harvest</td>
<td>5.6</td>
</tr>
<tr>
<td>Height of tallest sucker at flowering (cm)</td>
<td>266.3</td>
</tr>
<tr>
<td>Height of tallest sucker at harvest (cm)</td>
<td>321.2</td>
</tr>
<tr>
<td>Youngest leaf spotted at flowering</td>
<td>9.1</td>
</tr>
<tr>
<td>Youngest leaf spotted at harvest</td>
<td>4.0</td>
</tr>
<tr>
<td>Survival rate (%)</td>
<td>100</td>
</tr>
</tbody>
</table>

* Data are averages for 10 plants evaluated over three crop cycles.

**Reaction to diseases and pests**

The scores for number of functional leaves and youngest leaf spotted at flowering and harvest indicate good resistance to black leaf streak.
